Folder Security

Folder Security is an efficient and user-friendly utility whose main function is to help you protect the most important files and folders on your computer from unauthorized access. The application works by using several layers of protection. As such, launching Folder Security requires you to input one password, while accessing a secured directory means you need to enter another password. Folder Security allows you to both lock and hide a folder using a password you devise. This means that people who do not have the correct access key will not even be able to see the directory you protected. In order to lock a folder, you will have to input its full path, create and confirm your password, choose your security questions and answers, then press the 'Lock' button. The program will then protect your directory and add it to the main window. If you want to hide a directory, you can use an image or an audio file as a cover. You will then need to select the specific picture or song that you want to work with, and follow a series of steps similar with those taken when locking a folder. Folder Security can be added to your Windows context menu, so by simply right-clicking a folder, you can immediately lock it and prevent anyone else from accessing it without your knowledge. Moreover, this utility provides you with a series of tools, such as the 'Application Blocker' that can disallow games for instance, while the 'Website Blocker' can be used to prevent connection to social media sites. The 'Drive Manager' enables you to restrict access to certain volumes on your system. Other functions include the 'Text Hider', 'Content Hider', 'User Hider', 'USB Port Security' and more. With Folder Security, you can fully control the files, folders and drives can be accessed or even seen on your computer, thus preventing the use of your data without your approval. What's New In Folder Security?

Folder Security is a tool to provide user with an intuitive and easy to use tool to protect the data contained on the computer. This software protects the data even after restarting the computer or booting into Safe Mode. This means that the files in this type of folders can be accessed at any time after booting into the system. Folder Security works using a concept called file-level encryption. In case the counter-sign is not provided by the user, a hint will be displayed. The application can be installed on the computer using a simple wizard. During installation, the application will ask for the details that will be used to decrypt the folders. These include the counter-sign and the hint. Once installed, the application will show the user a list of folders and objects that have been locked by the application. All files that are located in locked folders will be inaccessible to the user. Folders that have been locked by the application can be transferred to a different computer or removable drive where they can be unlocked if the application is installed on the system. Main features: - File-level encryption - Password protection with a counter-sign - Password Protection of data even after restarting the computer - Password Protection of data even after booting into Safe Mode - Password protection even with removable drives - Password protection even with portable drives - Password protection even with shared folders - Password protection of folders containing the files of the Windows operating system - Password protection of folders containing the files of other applications - Password protection of folders containing the files of documents and images - Password protection of folders containing the files of document templates - Password protection of files containing the files of document templates - Password protection of files containing the files of e-mail - Password protection of files containing the files of Mail - Password protection of files containing the files of Microsoft Office Word documents - Password protection of files containing the files of Microsoft Office Excel documents - Password protection of files containing the files of Microsoft Office PowerPoint documents - Password protection of files containing the files of Microsoft Office Outlook documents - Password protection of files containing the files of Microsoft Office HTML documents - Password protection of files containing the files of Microsoft Office RTF documents - Password protection of files containing the files of Microsoft Office PDF documents - Password protection of files containing the files of Microsoft Office Open XML documents - Password protection of files containing the files of Microsoft Office JPG documents - Password protection of files containing the files of Microsoft Office JPEG documents - Password protection of files containing the files of Microsoft Office TIFF documents - Password protection of files containing the files of Microsoft Office BMP documents - Password protection of files containing the files of Microsoft Office GIF documents - Password protection of files containing the files of Microsoft Office PNG documents - Password protection of files containing the files of Apple documents - Password protection of files containing the files of Apple Keynote documents - Password
