(1) South Central Pacific Railroad. Download Version. At Railroad Corporation.,1. Field of the Invention The invention relates to a method for manufacturing a semiconductor device. 2. Description of the Related Art A memory cell that stores information by accumulating electric charges, for example, in a floating gate made of polysilicon, is often used in a semiconductor device such as a flash memory. The memory cell is generally disposed on a semiconductor substrate. A source and a drain are provided on both sides of the floating gate in the substrate direction. The semiconductor substrate, the floating gate, the source and the drain form a n-channel MOSFET (Metal Oxide Semiconductor Field-Effect Transistor). In order to write or read information into/from the memory cell, a voltage is applied between the source and the drain. When the voltage is applied, a current flows between the source and the drain. This drain current is called a drain current. Usually, the floating gate stores charges by the applied voltage, the drain current is increased by increasing the voltage. In such a semiconductor device, a voltage that activates a current (a threshold voltage) is usually applied to a control gate that controls the current of the MOSFET. By setting the threshold voltage to a low level, a large drain current is caused when the control gate is applied with a voltage that is necessary to write or read the information. By setting the threshold voltage to a high level, the drain current is suppressed when the control gate is applied with the voltage that is necessary to write or read the information. There is a case where a memory cell requires an increased operating speed to read or write information. In such a case, it is considered to lower the threshold voltage to increase the drain current (hereinafter, referred to as enhanced-drain operation) (for example, U.S. Pat. No. 6,011,283, Japanese Patent Publication No. 2003-171846). However, when the threshold voltage is lowered by the enhanced-drain operation, the power consumption is increased by about 100 times compared to usual operation (usually, the threshold voltage is set to a sufficiently
