Publisher: Maxon Media, Inc. Release Date: July 18, 2010 Price: Free File Size: 3.87 MB A: I'm not sure I understand why you need a GUI for that. However, if you are running Ubuntu 11.04 or above, i.e. 11.10 and later, you can use the nexuiz and nexuiz-scenegraph packages. `sudo apt-get install nexuiz nexuiz-scenegraph` They are not as pretty as Pen Oasis Crack Mac, but they work. EDIT: I just looked at Pen Oasis Crack Keygen. It has a Linux installer for 32 and 64 bit. If you install the "nexuiz" or "nexuiz-scenegraph" package, you can try those out as well. They both come in a RPM package as well if you are on a Debian system, if you can't find them in the Ubuntu repositories. A: There are a few commands that you can use to test if your network is vulnerable: Nmap `nmap -O -T4 -p TCP 192.168.0.1` (Obviously, substitute the IP address of the IP you want to test and the port of the port you want to test.) Nmap works by contacting a remote host to test if your computer is able to connect to it. If the remote host responds and can be reached, it is because your network is secure; if no response is received, it is because the network is probably vulnerable to a number of different types of attacks. ArpScan `arpscan 192.168.0.0/24` (Again, replace the IP address and subnet of the IP you want to test, but it will scan the entire subnet.) arpscan will run a scan of the subnet you specify and will display the arp table on your local computer. The arp table will show the IP addresses that responded to the scan and the type of IP addresses that responded. This is useful for determining if your network is vulnerable to DoS attacks, for example. Nmap + arp scan in combination `Nmap -O -T4 -p TCP 192.168.0`
